The protein enables flower colour to be controlled via regulation of the vacuolar pH, colours can range from bl to red in colour spectrum. The protein is useful in controlling flower colour to give new breeds of colourful plants for cut flowers, particularly applicable in horticulture.

The Na+ and H+ antiporter protein and gene encoding it are useful for the preparation of transformed plants with high salt tolerance, e.g. for growth in arid land.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 24-SEP-1998;

The protein enables flower colour to be controlled via regulation of the vacuolar pH, colours can range from blue to red in colour spectrum. The protein is useful in controlling flower colour give new breeds of colourful plants for cut flowers, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Morning glory-originated gene encoding a protein with pH regulation activity in vacuoles, useful in controlling flower colon to give ne breeds of colorful plants for cut flowers, particularly applicable

The protein enables flower colour to be controlled via regulation of the vacuolar pH, colours can range from blue to red in colour spectrum. The protein is useful in controlling flower colour to give new breeds of colourful plants for cut flowers, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Morning glory-originated gene encoding a protein with pH regulation activity in vacuoles, useful in controlling flower color to give new breeds of colorful plants for cut flowers, particularly applicable

The invention relates to OSNHX1 and nucleic acids which encode it; vectors, host cells and transgenic; containing OSNHX1 nucleic acids; recombinant expression of OSNHX1; antibodies which recognise OSNHX1. OSNHX1 nucleic acids are useful production of salt tolerant transgenic plants.
                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a plant Na/H antiport (PNHX) transporter polypeptide, or a fragment capable of increasing salt tolerance in a cell. This sequence corresponds to the AtNHX1 transporter from Arabidopsis thaliana. The Na/H transporter polypeptides provide a means of intracellular salt management, particularly in plants. The sequences are useful for producing transgenic plants that are capable of surviving in soil with high salt levels that would normally inhibit growth of the crop species. This would be useful in farming land in areas that are generally considered unproductive through salt accumulation and poor irrigation, e.g. in Indla, Australia, and prairies in USA or Canada. Commercial crops, such as potatoes, tomatoes, brassica, cotton, sunflower, strawberries, spinach, lettuce, rice, soybean, corn, wheat, rye, barley, atriplex, sorghum, alfalfa, salicornia and others would benefit from increased salt tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The protein enables flower colour to be controlled via regulation of the vacuolar pH, colours can range from blue to red in colour spectrum. The protein is useful in controlling flower colour to give new breeds of colourful plants for cut flowers, particularly .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Morning glory-originated gene encoding a protein with pH regulation activity in vacuoles, useful in controlling flower color to give ne breeds of colorful plants for cut flowers, particularly applicable

                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid molecule encoding a plant Na/H antiport (PNHX) transporter polypeptide, or a fragment and capable of increasing salt tolerance in a cell. This sequence corresponds to a transporter from Arabidopsis thaliana. The Na/H transporter polypeptides provide a means of intracellular salt management, particularly in plants. The sequences are useful for producing transgenic plants that are capable of surviving in soil with high salt levels that would normally inhibit growth of the crop species. This would be useful in farming land in areas that are generally considered unproductive through salt accumulation and poor irrigation,
                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;

```

The sequence represents an Arabidopsis thaliana AtNHX1 polypeptide which

Transgenic plants with salt tolerance, and increased yield and flower size con

vacuolar pyrophosphatase

expression comprise

drought and freeze

resistance genes or

Example 1; Fig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is a tonoplast pyrophosphatase hydrogen ion (H+) translocating pump. Transgenic plants can be made by transforming plant cells with exogenous tonoplast pyrophosphate driven H+ pump genes and an exogenous nucleic acid encoding a protein, such as AVP1, which alters expression of vacuolar pyrophosphatase. Salt tolerance may be introduced into a plant via transformation of the cells to induce upregulation of vacuolar phosphashase expression. Drought and/or freeze tolerance may also be introduced through transformation with DNA encoding a vacuolar H+ translocating pump linked to a promoter such as the 35s promoter. These processes are useful for bioremediating soil and removing cations such as sodium, calcium, manganese and lead from soil or water which can support plant growth. Plants which grow in saline soil can be produced and yield and flower size of plants can be increased.

                                                                                                                                                                                                                                                                                                                                                                                                                              The Na/H transporter polypeptides provide a means of intracellular salt management, particularly in plants. The sequences are useful for producing transgenic plants that are capable of surviving in soil with high salt levels that would normally inhibit growth of the crop species. This would be useful in farming land in areas that are generally considered unproductive through salt accumulation and poor irrigation, e.g. in India, Australia, and prairies in USA or Canada. Commercial crops, such as potatoes, tomatoes, brassica, cotton, sunflower, strawberries, spinach, lettuce, rice, soybean, corn, wheat, rye, barley atriplex, sorghum, alfalfa, salicornia and others would benefit from
                                                                                                                                                                                                                                                                                                                                                                                                                 strawberries, spinach, lettuce, rice, s
atriplex, sorghum, alfalfa, salicornia
increased salt tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule encoding a plant Na/H antiport (PNHX) transporter polypeptide, or a fragment and capable of increasing salt tolerance in a cell. This sequence corresponds to the AtNHX2 transporter from Arabidopsis thaliana.
                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecules encoding sodium/proton transport polypeptides, useful in genetic engineering salt tolerance in crop plants .

                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

```

The invention relates to novel cat flea (Ctenocephalides felis) nucleicids which are expressed in hindgut and Malpighian tubule (HMT) tion or head and nerve cord (HMC) tissue. The invention also relates to

nucleic

the

encoded proteins. The invention additionally encompasses expression constructs, recombinant viruses and recombinant cells comprising the nucleic acids of the invention, recombinant production of the protein antibodies against the proteins, a method of identifying inhibitors of the proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC the proteins, and compositions comprising the inhibitors for CC administration to an animal. The nucleic acids, and the proteins they CC encode may be used in the prevention, treatment and diagnosis of diseases CC associated with flea infestations. For example, the nucleic acids may be Used to produce an HMT or HNC protein according to standard recombinant CC DNA methodology by inserting the nucleic acids into a host cell and CC culturing the cell to express the protein. The HMT and HNC nucleic acids CC may also be used as DNA probes in diagnostic assays (e.g., PCR) to detect CC and quantitate the presence of cat flea or other homologous nucleic acid Sequences in samples. They may also be used to study the expression and CC function of the proteins and their role in metabolism. The HMT and HNC CC proteins may be used as antigens in the production of specific anti-HMT/HNC protein assays to identify modulators (agonists and cativity. The CC antibodies, and in assays to identify modulators (agonists and activity. The CC downregulate protein expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of flea polypeptides in samples (e.g., by enzyme linked immunosorbent assay (ELISA)). The CC in samples (e.g., by enzyme linked immunosorbent assay (ELISA)). The

                                                                          The invention relates to an isolated nucleic acid molecule encoding a plant Na/H antiport (PNHX) transporter polypeptide, or a fragment and capable of increasing salt tolerance in a cell. This sequence corresponds to an Na/H antiport transporter from the budding yeast saccharomyces cerevisiae. The Na/H transporter polypeptides provide a means of intracellular salt management, particularly in plants. The sequences are useful for producing transgenic plants that are capable of surviving in soil with high salt levels that would normally inhibit growth of the crop species. This would be useful in farming land in areas that are generally considered unproductive through salt accumulation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid molecule encoding CC a plant Na/H antiport (PNHX) transporter polypeptide, or a fragment CC and capable of increasing salt tolerance in a cell. This sequence CC corresponds to an Na/H antiport transporter from the fission yeast CC schizosaccharomyces pombe. The Na/H transporter polypeptides provide CC a means of intracellular salt management, particularly in plants. The CC sequences are useful for producing transgenic plants that are capable CC of surviving in soil with high salt levels that would normally inhibit CC growth of the crop species. This would be useful in farming land in areas CC that are generally considered unproductive through salt accumulation and CC commercial crops, such as potatoes, tomatoes, brassica, cotton, CC sunflower, strawberries, spinach, lettuce, rice, soybean, corn, wheat, CC rye, barley, atriplex, sorghum, alfalfa, salicornia and others would cC benefit from increased salt tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Na+/H+-exchanging protein - Chinese hamster
N;Alternate names: Na+/H+ antiporter; Na+/H+ exchanger
C;Species: Cricetulus griseus (Chinese hamster)
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change
C;Accession: S30198; S29541
C;Accession: L; Pouyssegur, J.
Biochim. Biophys. Acta 1172, 343-345, 1993
A;Title: Nucleotide sequence of the Chinese hamster Na(+)/H(+) e
A;Reference number: S30198; MUID:93192332

A40204
A40204
Na+/H+-exchanging protein 1 - rat
N; Alternate names: Na+/H+ antiporter
C; Species: Rattus norvegicus (Norway rat)
C; Date: 28-Aug-1992 #sequence_revision 28-Aug-1992
C; Accession: A40204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R;Orlowski, J.; Kandasamy, R.A.; Shull, G.E. J. Blol. Chem. 267, 9331-939, 1992
A;Title: Wolecular cloning of putative members rally related proteins.
A;Reference number: A40204
A;Recession: A40204
A;Status: preliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     C; Keywords: transmembrane
